

Anmol: From hypothesis to outcome

Hi, I'm Anmol.

I'm the Head of Large Advertiser Marketing Analytics
within the Marketing Team at Google.

At its core, my job is about connecting
the right user with the right message at the right time.

The first step is really to get
a broad sense of the certain pattern that's occurring.

So for example, we know that this particular segment
of users is more responsive to this type of content.

Once we're able to actually see
this hypothesis through the data,
we do testing to ensure
that the hypothesis is actually correct.

So for example, we would test
sending these pieces of content to this segment of users,
and actually verify within a controlled environment
whether that response rate is
actually higher for that type of content,
or whether it isn't.

Once we're able to actually verify that hypothesis,
we go back to the stakeholders,

in this case, our marketers, and say,
we've proven within a relatively high degree of certainty
that this particular segment is more
responsive to this type of content, and because of that,
we're recommending that you
produce more of this type of content.

Our stakeholders really get to see
the whole evolution from hypothesis to proven concept,
and they're able to
come with us on the journey on how we're proving out
these hypotheses and then eventually turning them
into strategies and recommendations for the business.

The outcome in this case was that we
were able to actually change the way
our whole marketing team worked
to actually make it much more **user-centric**.

Instead of, from our **perspective**,
coming up with content that we think the users need,
we're actually going in the other direction of
figuring out what users need first,
proving that they need
certain things or they don't need certain things,
and then using that information going back to marketers
and coming up with content that fulfills their need.
So it really changed the direction of
how we produce things.
