

Data and decisions

Welcome back. Now it's time to
go even further and build on what you've
learned about problem-solving in
data analytics and crafting effective questions.
Coming up, we'll cover a wide range of topics.
You'll learn about how data can empower
our decisions, big and small;
the difference between
quantitative and qualitative analysis
and when to use them;
the pros and cons of different data visualization tools;
what metrics are, and how analysts use them;
and how to use mathematical thinking to connect the dots.
To be honest, I'm still learning
more about these things every day,
and so will you! Like how
quantitative and qualitative data can work together.
In my role in finance,
most of my work is quantitative,
but recently I was working on a project that focused
a lot on empathy and trust

and that was really new for me.

But we took those more qualitative things
into account during analysis,
and that really helped me understand how
quantitative and qualitative data can come
together to help us make powerful decisions.

Now you're on your way to building
your own data analyst toolkit.

Before you know it,
you'll be analyzing all kinds of data
yourself and learning new things while you do it.

But first, let's start
small with the power of observation.
