

Test your knowledge on using functions in spreadsheets

1. In this spreadsheet, what will be returned from the function `=SUM(B1:B4)`?

1 / 1 point

(n/a)	A	B	C	D	E
1	9	3	7	6	8
2	3	2	3	7	2
3	5	6	9	2	3
4	7	4	1	2	4

- ☒ 15
☐ 9
☐ 7
☐ 13

✓ Correct

The function `=SUM(B1:B4)` will return 15. **SUM** is a spreadsheet function that adds the values of a selected range of cells.

2. What is the correct way to write a function that will find the average of all values in the range of cells from F1 to F10 in a spreadsheet?

1 / 1 point

- ☐ `=AVERAGE(F1, F10)`
☐ `=(F1-F10)`
☐ `AVERAGE(F1+F10)`
☒ `=AVERAGE(F1:F10)`

✓ Correct

To find the average of all values between cells F1 and F10, the function is `=AVERAGE(F1:F10)`. **AVERAGE** is a spreadsheet function that returns an average of the values from a selected range.

3. In this spreadsheet, what will be returned from the function **=MIN(D1:D4)**?

1 / 1 point

(n/a)	A	B	C	D	E
1	95	37	1	6	27
2	5	0	49	31	5
3	78	2	6	2	3
4	6	33	1	62	40

- ☐ 95
- ☐ 62
- ☐ 0
- ☒ 2

✔ Correct

The function **=MIN(D1:D4)** will return 2. **MIN** is a spreadsheet function that returns the smallest numeric value from a range of cells.

4. What is the correct way to write a function that will find the greatest value in the range of cells from G60 to G100 in a spreadsheet?

1 / 1 point

- ☐ (G60^G100)
- ☒ **=MAX(G60:G100)**
- ☐ GREAT(G60-G100)
- ☐ =(G60:G100)MAXIMUM

✔ Correct

To find the greatest value between cells G60 and G100, the function is **=MAX(G60:G100)**. **MAX** is a spreadsheet function that returns the largest numeric value from a range of cells.
