

Introduction to bias, credibility, privacy, and ethics

Welcome back. In an earlier course, we talked about how to prepare data in a way that helps you tell a meaningful story. Now let's find out what comes next. Like all good tales, your data story will be filled with characters, questions, challenges, conflict, and hopefully a resolution. The trick is to avoid the conflict, overcome the challenges and answer the questions. That's what this course is all about. Here's how we'll do it. First, you'll learn how to analyze data for bias and credibility. This is very important because even the most sound data can be skewed or misinterpreted. Then we'll learn about the importance of being good and bad. Yep, just like when we were kids. But in this case, we'll be exploring good data sources and learning how to steer clear of their nemesis, bad data. After that, we'll learn more about the world of data ethics, privacy and access. As more and more data becomes available, and the algorithms we create to use this data become more complex and sophisticated, new issues keep popping up. We need to ask questions like, who owns all this data? How much control do we have over the privacy of data? Can we use and reuse data however we want to? As a data analyst, it's important to understand data ethics and privacy because in your work, you'll make a lot of judgment calls on the correct use and application of data. I'm excited to walk you through some of the questions, answers, risks and rewards involved. Let's open up the first chapter of this data story in our next video.
