

Self-Reflection Protect your resources

Activity Overview

Now that you have learned about the importance of data security, you can pause for a moment and think about what you are learning. In this self-reflection, you will consider your thoughts about data privacy, collaboration, and version control, then respond to brief questions.

This self-reflection will help you develop insights into your own learning and prepare you to apply your knowledge of data privacy to your experience with Kaggle. The data privacy skills you're developing will apply to many of the tools you'll use throughout your career as a data analytics professional. This is an example of a transferable skill: your understanding of data privacy in Kaggle can be applied to other tools in the future.

As you answer questions—and come up with questions of your own—you will consider concepts, practices, and principles to help refine your understanding and reinforce your learning. You've done the hard work, so make sure to get the most out of it: This reflection will help your knowledge stick!

Follow the steps to learn how Kaggle helps you manage your data. Then answer the question at the end of the activity before going to the next course item.

On Kaggle, you can upload your own datasets and keep them private. This means that they are visible and accessible by only you. You also have the option to add collaborators to your dataset, whom you can add as viewers or editors. Viewers are able to see your private dataset and editors are able to make changes to your private dataset.

You can share the link to your private dataset so anyone with the link is able to view it. If you don't want this feature, [you can disable it in the Settings tab of your dataset](#).

Note: If you have a private dataset on Kaggle and you choose to make it public, **you will not be able to make the dataset private again**. The only option you would have is to delete the dataset from Kaggle completely.

Any notebooks that you create on Kaggle are private by default. Like in datasets, you can add collaborators as viewers or editors. You can also make a notebook public, which will share it with the entire Kaggle community.

If you add collaborators to your Kaggle notebook, they can make changes to it. You want to make sure you communicate and coordinate with your collaborators because the last person who saves the notebook will overwrite all of the previous work. If you'd like more fine-grained control of changes to your code, a system like GitHub provides more version control.

As for version control, Kaggle has its own style of letting you keep records of your progress. You can read all of the details [in this post](#), but think back to when you've done some work in a Kaggle notebook and clicked on the Save Version button.

When you clicked this button then clicked **Save**, you did it without changing anything. But you also have the option to add a short descriptive note about what changes you've made.

This can be helpful when you've made changes to your notebook but want to go back to an earlier version. To do this, go to **Edit** mode and click on the number next to the **Save Version** text at the top of your notebook.

This will open a navigation bar on the right side of the screen and list out all of the versions of your notebook. When you click on different versions of your notebook, the left side of the screen will populate with the code and text from that version.

Version History

Version 1

Save & Run All • Diff: +23 -0

Running...

1m ago

...

Then, once the version has run, your screen will appear like this:

```
In [1]: # This Python 3 environment comes with many helpful analytics libraries installed
# It is defined by the kaggle/python Docker image: https://github.com/kaggle/docker-python
# For example, here's several helpful packages to load

import numpy as np # linear algebra
import pandas as pd # data processing, CSV file I/O (e.g. pd.read_csv)

# Input data files are available in the read-only "../input/" directory
# For example, running this (by clicking run or pressing Shift+Enter) will list all files under the input directory

import os
for dirname, _, filenames in os.walk('/kaggle/input'):
    for filename in filenames:
        print(os.path.join(dirname, filename))

# You can write up to 20GB to the current directory (/kaggle/working/) that gets preserved as output when you create a version using "Save & Run All"
# You can also write temporary files to /kaggle/temp/, but they won't be saved outside of the current session

/kaggle/input/heart-disease-uci/heart.csv

In [2]: df=pd.read_csv('../input/heart-disease-uci/heart.csv')
df.head()
```

	Ran in 54 seconds	

From this screen you can also open the version in **Viewer** mode, pin a version as the default, or even change the version name. Pinning a version as the default can be helpful when you have a working version of your notebook available to the Kaggle community, but want to make changes and updates that might not work the first time you implement them. This allows you to safely make changes behind the scenes while sharing with the Kaggle community the most recent working version of your notebook.

1.

Question 1

Reflection

Consider what you learned about data security in Kaggle:

- What are some cases in which you should use the privacy, collaboration, and version control features on Kaggle?
- What other scenarios can you think of where you might want to *pin* a different version of your notebook other than the most recent version?

Now, write 2-3 sentences (40-60 words) in response to each of these questions. Enter your response in the text box below.

When my data is very sophisticated and only necessary for me, then I use the privacy feature on Kaggle. When I want to develop a great project through the Kaggle community, then I use the collaboration. And version control is a very important feature for updating the notebook and dataset; when I use the collaboration, then I use the version control. I can also use the version control when I use the private data.

Yeah, pinning a different version is very useful because when I work on a huge project and then we update the file or notebook, it is very important to know the changes and version of the changes. So, I think that we have to always differentiate and pin a different version than the most recent version.

Feedback

Great work reinforcing your learning with a thoughtful self-reflection! A good reflection on this topic would include how and when you should apply your knowledge of data privacy and version control when working in Kaggle.

Understanding how to maintain privacy and record your progress with version control are essential skills for data analyst jobs, where you are often expected to collaborate with other analysts. Knowing about privacy standards and how to ensure effective collaboration will prevent you from exposing important data or losing precious work. Going forward, you can apply your knowledge of data security to other platforms or your future projects.
