

Use SQL to clean data

Welcome back and great job on that last weekly challenge. Now that we know the difference between cleaning dirty data and some general data cleaning techniques, let's focus on data cleaning using SQL. Coming up we'll learn about the different data cleaning functions in spreadsheets and SQL and how SQL can be used to clean large data sets. I'll also show you how to develop some basic search queries for databases and how to apply basic SQL functions for transforming data and cleaning strings.

Cleaning your data is the last step in the data analysis process before you can move on to the actual analysis, and SQL has a lot of great tools that can help you do that. But before we start cleaning databases, we'll take a closer look at SQL and when to use it.

I'll see you there.
