

Test your knowledge on SQL queries

1. What are some key benefits of using SQL for data analytics projects? Select all that apply.

1 / 1 point

☐ Insertable images and text formatting

☒ Powerful data cleaning tools

Correct

SQL can handle huge amounts of data, can be adapted and used for multiple database programs, and offers powerful tools for cleaning data.

☒ Adaptable for multiple database programs

Correct

SQL can handle huge amounts of data, can be adapted and used for multiple database programs, and offers powerful tools for cleaning data.

☒ Manage huge amounts of data

Correct

SQL can handle huge amounts of data, can be adapted and used for multiple database programs, and offers powerful tools for cleaning data.

2. Which SQL function cleans string variables by extracting a substring from a string variable?

1 / 1 point

☒ SUBSTR

☐ LENGTH

☐ LEN

☐ COUNTIF

Correct

SUBSTR cleans string variables by extracting a substring from a string variable.

3. You are working with a database table that contains data about playlists, and you discover there are duplicate entries. What SQL clause will remove the duplicates from the playlist_id column?

1 / 1 point

- ☐ `SELECT DUPLICATE playlist_id`
- ☐ `SELECT ONLY playlist_id`
- ☐ `SELECT REMOVE playlist_id`
- ☒ `SELECT DISTINCT playlist_id`

✓ Correct

To remove duplicates from the playlist_id column, use the clause: `DISTINCT playlist_id`. `DISTINCT` is a keyword that is added to a SQL `SELECT` statement to retrieve only non-duplicate entries.

4. You are working with a database table that contains data about turtles. What SQL clause will return any turtle ages that are less than three digits long from the turtle_age column?

1 / 1 point

- ☐ `LENGTH turtle_age < 3`
- ☐ `LENGTH(turtle_age) > 3`
- ☒ `LENGTH(turtle_age) < 3`
- ☐ `LENGTH turtle_age > 3`

✓ Correct

To return any turtle ages that are less than three digits long from the turtle_age column, use the clause: `LENGTH(turtle_age) < 3`. `LENGTH` returns the length of a text string by counting the number of characters or digits it contains.

5. You are working with a database table that contains data about cookbooks. What SQL clause will retrieve the first eight letters of each data point in the recipe_name column, then store the result in a new column called recipe_listing?

1 / 1 point

- ☐ `SUBSTR(recipe_name, 8) AS recipe_listing`
- ☒ `SUBSTR(recipe_name, 1, 8) AS recipe_listing`
- ☐ `SUBSTR(recipe_name, 8) to recipe_listing`
- ☐ `SUBSTR(recipe_name, 1, 8) new_recipe_listing`

✓ Correct

To retrieve the first eight letters of each data point in the recipe_name column, then store the result in a new column called recipe_listing, use the clause: `SUBSTR(recipe_name, 1, 8) AS recipe_listing`. `SUBSTR` extracts a substring from a string variable, and `AS` assigns the new column for the extracted substring.
