

Module 4 challenge

1. Fill in the blank: A data analyst keeps important code in a _____, enabling other developers on the team to access the most current version of the code and collaborate effectively.

1 point

- ☒ changelog
- ☐ dashboard
- ☐ version control system
- ☐ dataset

✗ **Incorrect**
Review [the reading about changelogs](#). ↗

2. You are a data analyst working for an e-commerce company. You have just finished cleaning data from a customer survey whose original objective was to gather feedback on specific usability issues within the mobile app checkout process. While reviewing the cleaned data and preparing for verification, you notice that a large number of respondents complain about slow website loading times on desktop computers, which was not related to the mobile app checkout.

1 / 1 point

Based on the principles of data verification and taking the "big picture view," what is the most critical *first step* you should take in this situation?

- ☐ Remove from the dataset all survey responses that mention desktop loading times.
- ☐ Immediately begin a separate analysis of the website loading time comments, as this appears to be a significant customer pain point.
- ☒ Pause and reassess whether focusing on the desktop loading time comments aligns with the original project goal centered on the mobile app checkout usability.
- ☐ Ask a teammate to double-check your cleaning process to ensure no data related to desktop loading times was accidentally duplicated or introduced.

✓ **Correct**

3. Which SQL clause will consider the condition 'Florida' and return the value 'East' when that condition is met?

1 / 1 point

☐

```
WHEN  
CASE us_states = 'Florida' THEN 'East' END
```

☐

```
WHEN us_states = 'Florida' CASE 'East' END
```

☒

```
CASE  
WHEN us_states = 'Florida' THEN 'East' END
```

☐

```
CASE us_states = 'Florida' THEN 'East' END
```

✓ Correct

4. A data analyst uses a changelog to record how the data evolves while cleaning their data. What data cleaning best practice does this describe?

1 / 1 point

- ☐ Disclosure
- ☒ Documentation
- ☐ Illumination
- ☐ Examination

✓ Correct

5. During verification, you notice an error in a dataset. You remember fixing a similar error when previously cleaning the data. What tool can you reference to find documentation about how to fix the error?

1 / 1 point

- ☐ Text editor
- ☐ Data table
- ☐ Notepad
- ☒ Changelog

✓ Correct

6. A data analyst uses a pivot table in Google Sheets to determine how many times a particular country name occurs within a dataset. What function will provide the required information?

1 / 1 point

- ☐ CASE
- ☐ CONCAT
- ☐ CHECK
- ☒ COUNTA

✓ Correct

7. Reporting on data cleaning efforts and gathering feedback provides value beyond simply verifying the data's accuracy. What is a primary benefit of this feedback loop?

1 / 1 point

- ☒ It helps identify underlying issues in data collection or systems (like poor survey design or integration problems) which can then be fixed to prevent future errors.
- ☐ It allows the analyst to request more time and resources for future data cleaning projects from management.
- ☐ It serves mainly as proof to stakeholders that the analyst followed the correct cleaning procedures step-by-step.
- ☐ Its main purpose is to create detailed documentation of the errors found, strictly for historical record-keeping and audit trails.

✓ Correct

8. Fill in the blank: To correct a misspelling in their spreadsheet, a data professional uses _____ to search for any instance of "compurer" and change it to "computer."

1 / 1 point

- ☐ Remove duplicates
- ☐ TRIM
- ☒ find and replace
- ☐ formatting

✓ Correct
