

Test your knowledge on organizing data for analysis

1. Fill in the blank: The goal of analysis is to identify _____ within data in order to accurately answer questions and solve problems.

1 / 1 point

- ☐ all possible insights
- ☐ value and meaning
- ☐ opportunities and risks
- ☒ trends and relationships

✓ **Correct**

The goal of analysis is to identify trends and relationships within data in order to accurately answer questions and solve problems.

2. A data analyst organizes a database to show only the 100 most recent real estate sales in Stamford, Connecticut. What steps do they take?

1 / 1 point

- ☒ Add a filter to return only sales in Stamford, Connecticut, then sort the most recent sales at the top of the list.
- ☐ Filter out sales in Stamford, Connecticut, then sort the most recent sales at the top of the list.
- ☐ Filter out sales in Stamford, Connecticut, then sort the least recent sales at the top of the list.
- ☐ Add a filter to return only sales in Stamford, Connecticut, then sort the least recent sales at the top of the list.

✓ **Correct**

The data analyst adds a filter for only sales in Stamford, Connecticut, then sorts the most recent sales at the top of the list.

3. What term describes data points that are very different from similarly collected data and, therefore, might not be reliable values?

1 / 1 point

- ☐ Errors
- ☒ Outliers
- ☐ Norms
- ☐ Noise

✓ **Correct**

Outliers are data points that are very different from similarly collected data and might not be reliable values.

4. In what way is the SQL **WHERE** clause similar to filtering in spreadsheets?

1 / 1 point

- ☐ Both the **WHERE** clause and spreadsheet filters enable efficient sorting of data.
- ☐ Both the **WHERE** clause and spreadsheet filters enable data professionals to remove duplicate columns.
- ☒ Both the **WHERE** clause and spreadsheet filters return a subset of data based on specified criteria.
- ☐ Both the **WHERE** clause and spreadsheet filters can be used to create pivot tables.

✓ **Correct**

The **WHERE** clause is similar to filtering in spreadsheets because both return a subset of data based on specified criteria.
