

Test your knowledge on sorting data with SQL

1. A data analyst at a gift retailer sorts a list of handmade candles by price from least expensive to most expensive. Which statement do they use?

1 / 1 point

- ☐ `WHERE candle_price ASC`
- ☐ `ORDER BY candle_price DESC`
- ☐ `WHERE candle_price`
- ☒ `ORDER BY candle_price`

✓ Correct

They use `ORDER BY candle_price`. An `ORDER BY` statement sorts in ascending order by default. `ORDER BY column_title` is the syntax for this query.

2. What will this query return?

1 / 1 point

```
1 SELECT *
2 FROM widgets
3 ORDER BY
4     manufacture_date DESC
```

- ☒ All of the rows in the widgets table, with the most-recently manufactured widgets listed first
- ☐ All of the columns in the manufacture_date table
- ☐ All of the rows in the widgets table
- ☐ All of the rows in the widgets table, with the least-recently manufactured widgets listed first

✓ Correct

The query will return all of the rows in the widgets table, ordered by the `manufacture_date` column in descending order. This means the most recently manufactured widgets will be returned first.

3. You are working with a database table that contains employee data. Which **ORDER BY** clause will sort employees by the earliest hire dates at the top of the list?

1 / 1 point

- ☐ **ORDER BY hire_date DESC**
- ☒ **ORDER BY hire_date ASC**
- ☐ **ORDER BY hire_date REV**
- ☐ **ORDER BY hire_date MIN**

✓ **Correct**

4. What SQL operator enables a data professional to filter for two conditions at once when using a **WHERE** statement?

1 / 1 point

- ☐ Plus sign +
- ☐ **IN**
- ☐ Ampersand &
- ☒ **AND**

✓ **Correct**

The **AND** operator enables a data professional to filter for two conditions at once when using a **WHERE** statement.
