

Review subqueries

Features of subqueries

A subquery is a SQL query nested inside a larger query. Review a series of statements about subqueries and answer whether they are true or false.

True or false?

Review the statement and select whether it is true or false.

Statement

A subquery may be nested in a SELECT clause.

Answer

True ☒

False ☐

True or false?

Review the statement and select whether it is true or false.

Statement

You can use comparison operators such as >, <, or = within subqueries.

Answer

True ☒

False ☐

True or false?

Review the statement and select whether it is true or false.

Statement

A subquery is also called an outer query or outer select. The statement containing a subquery is called an inner query or inner select.

Answer

True ☐

False ☒

True or false?

Review the statement and select whether it is true or false.

Statement

The parent query executes before its inner query.

Answer

True ☐

False ☒

True or false?

Review the statement and select whether it is true or false.

Statement

Subqueries don't have to be enclosed within parentheses.

Answer

True

☐

False

☒

True or false?

Review the statement and select whether it is true or false.

Statement

A subquery can have more than one column specified in the SELECT clause.

Answer

False

☐

True

☒

True or false?

Review the statement and select whether it is true or false.

Statement

A subquery can't be nested in a SET command.

Answer

True

☒

False

☐

True or false?

Review the statement and select whether it is true or false.

Statement

Subqueries that return more than one row can only be used with multiple value operators.

Answer

True

☒

False

☐

You're done!

Subqueries make it possible to combine querying steps more efficiently so you can get more done in a single query.
