

Test your knowledge on SQL calculations

1. In a SQL query, what is the purpose of the modulo (%) operator?

1 / 1 point

- ☒ Return the remainder of a division calculation
- ☐ Convert a decimal to a percent
- ☐ Apply an exponent to a value
- ☐ Find the square root of a number

✓ **Correct**

The modulo operator returns the remainder of a division calculation.

2. A data professional writes a query that uses more than one arithmetic operator. What do they add to the query to control the order of the calculations?

1 / 1 point

- ☐ Dollar sign (\$)
- ☐ Backslash [/]
- ☒ Parenthesis [()]
- ☐ Colon [:]

✓ **Correct**

They add parentheses to control the order of the calculations.

3. Spreadsheet cell D5 contains the decimal .74. Which formula will convert it to a percentage?

1 / 1 point

- ☐ =D5,100
- ☐ =D5%100
- ☒ =D5*100
- ☐ =D5 (100)

✓ Correct

The formula =D5*100 will convert it to a percentage, 74%.

4. What will **GROUP BY** do in this query?

1 / 1 point

```
1 SELECT apartment, AVG(price) AS apt_prices
2 FROM rent_data
3 GROUP BY apartment;
```

- ☐ Group together the rent_data by apartment prices
- ☐ Group together the apartment and rent_data tables
- ☒ Group the rows in the table by apartment
- ☐ Group only the rows in the apt_prices table

✓ Correct

GROUP BY will group the rows in the table by apartment. This query calculates the average price for each apartment, putting the results in a new column called apt_prices.
