

Introduction to communicating data insights

Hey there, it's great to see how far you've come in this Google Data Analytics certificate. First of, I want to say congrats on your achievement. Second, welcome to your next course. It's all about the art of data storytelling through visualization. As a data analyst, you can do all the necessary work of planning, collecting, cleaning, and analysis. But you also need to show stakeholders what your data means in a compelling way using visuals. We're here to show you how that's done.

With my experience as Director of Analytics at Google, I hope I'll be a pretty good guide. My name's Kevin, and I'll be your instructor for this course. This part of your training is particularly meaningful to me because I love data storytelling. I can't think of anything in today's business world that's more vibrant, more exciting, and more rewarding. With the amount of data we have around us, data analytics plays a key role in pretty much every part of business. In my opinion, there isn't a skill that's more important to you as an analyst than being able to effectively communicate the stories you want to covered to stakeholders. Stakeholders usually lack the time, access to data, or expertise needed to find those stories by themselves.

That's why we'll focus on visualizing data to help you better share Data Stories. Which means we're now at the share phase of the data analysis process. We'll start with the basic concepts of visualization and why visualizing your analysis is such an important part of Data Analytics. From there, we'll discuss how to plan for and start building effective visualizations that are inclusive, accessible, and consider the audience first. Afterwards, we'll explore one possible tool you can use for data visualization, Tableau. Tableau helps us create visualizations from our analysis so that we can share our

findings more effectively. We'll show you how data visualizations, including visual dashboards, can help bring your data to life.

We'll also explore how you can use visualizations in your presentations and slide shows to continue telling a story with data. We'll discuss the art and science behind effective presentations. Finally, you'll learn how to anticipate and answer questions from stakeholders and respond to their feedback. Throughout the course, I'll guide you through what I think is the most exciting part of the data analysis process. By the end, you'll have everything you need to plan, create, and present an effective and compelling data visualization. Now that we've gotten to know each other little, it's time to get down to business. Coming up, we'll talk a bit about the history of data visualization and why visualizations mattered so much today.

We'll also discuss the methods for using imagery effectively and what you can do to make the most out of your visuals. See you there.
