

Wrap-up

You've developed a lot of new Python skills already. Well done. Along the way, you've discovered that Python is a powerful tool for data professionals, and learn how Python can help you work with your data quickly and efficiently. We began with a general introduction to the Python programming language, and explored how data professionals use Python to power the data analysis. Then we discussed Jupyter Notebooks. You learned about the main features of Jupyter Notebooks and how to write Python code in the notebook environment. Next, you explored the benefits of object-oriented programming for data professionals, and learned about its basic concepts.

After that, we focused on working with variables. You learned how to assign specific values to variables and effectively store and label your data. We also reviewed the standard naming conventions for variables. You learned useful guidelines for making your code clear, precise, and consistent. Finally, we explored different data types in Python, such as integers, floats, and strings. You learned how to convert and combine data types to organize your data. Coming up, you have a graded assessment.

To prepare, review the reading that lists all the new terms you've learned, and feel free to revisit videos, readings, and other resources that cover key concepts.

Congratulations on your progress so far, and I'll meet you again soon.

Review

- Introduction to Python
- Jupyter Notebook
- Object-oriented programming
- Variables
- Naming conventions
- Data types
