

## Wrap-up

You've added a lot of new Python skills to your skill set and gained valuable practice working with data. Well done. Along the way, we've explored how Python code can help you quickly perform complex operations on your data. You've also learned how to write clean, readable code that can be easily understood and reused by other data professionals. This is an important part of collaborating with teammates on any data project. Writing clean code will help your team reduce errors, work faster, communicate more effectively, and deliver better results. We began by exploring functions or reusable chunks of code that let you perform specific tasks.

Next, we discussed two important elements of writing clean code, reusability and modularity. We also discussed another best practice for writing clean code, commenting. After that, we've reviewed two types of Python operators, comparators and logical operators. And finally, you learned how to write conditional statements such as if, else, and else if statements. Coming up, you have a graded assessment. To prepare, review the reading that lists all the new terms you've learned. And feel free to revisit videos, readings, and other resources that cover key concepts.

Congratulations on your progress. Let's keep it going.

# Review

- Functions
- Writing clean code
- Commenting
- Operators
- Conditional statements
