

Test your knowledge: Dictionaries and sets

1. Fill in the blank: In Python, a dictionary's _____ must be immutable.

1 / 1 point

- ☐ order
- ☒ keys
- ☐ sets
- ☐ lists

✔ Nice work

In Python, a dictionary's keys must be immutable. Immutable keys include, but are not limited to, integers, floats, tuples, and strings. Lists, sets, and other dictionaries are not included in this category since they are mutable.

2. In Python, what does the `items()` method retrieve?

1 / 1 point

- ☐ A dictionary's sets
- ☐ Only a dictionary's keys
- ☐ Only a dictionary's values
- ☒ Both a dictionary's keys and values

✔ Nice work

In Python, the `items()` method is used to retrieve both a dictionary's keys and values.

3. A data professional is working with two Python sets. What function can they use to combine the sets (i.e., find all of the distinct elements that exist in one or both sets)?

1 / 1 point

- ☐ `intersection()`
- ☐ `symmetric_difference()`
- ☒ `union()`
- ☐ `difference()`

👍 Nice work

When working with two Python sets, a data professional can use the `union()` function to combine the sets (i.e., find all of the distinct elements that exist in one or both sets).
