

Rishie: What employers look for in data analysts

Google is a company that's built on data. It's all data-driven. And the idea behind it is that every person, whether you're an engineer, whether you're a marketer, a seller, or even you're working in admin, where you're handling logistics and paperwork and payrolls, everybody is dealing with data in some form or the other. We're trying to acknowledge the fact that in any occupation across the globe, across various industries, having a knack and understanding of data is going to be crucial for everyone. When you are in an interview, what I personally look for, what even my colleagues look for is the way they think about this creatively. When people hear the word "data analyst," they think about engineers or someone who is extremely technical, and it's all about working with data and numbers. But I implore people to rethink about that perception that being a data analyst is not being a scientist, but that it's also being an artist.

The entire world is your canvas. The way that you approach it and even sometimes challenge the traditional norms of solving a problem, I think that seems to be very powerful, and it actually puts you on the edge as compared to other people when you're interviewing for such roles. There's a misconception or a myth that when you're applying for a job, you should know all the right answers. You should answer every question that they ask correctly. But that's false. What every interviewer is looking for is how you

think, what's your thought process, what is your way of looking at a certain problem, and how do you approach solving those problems. When you express that, I mean, you talk a little bit more about how you think about in a certain perspective, why you think about in a certain perspective, it speaks a lot about you as a person and also what's your professional capability to be in that position.

One of the fascinating things about being a data analyst is you are a storyteller. You look at the data and every data point out there has a story to tell. If you are able to perfect that skill, you can tell some amazing stories. What people will remember is not just the data, but how you tell those stories to the people or to your audience. If you talk about the core essence of the story that this is what the data is telling me, or this is what the data tells you to do, you become a lot more successful. And I guarantee you that you will progress in being a data analyst and your career will prosper indefinitely. My name is Rishie, and I'm the Global Analytics Skills Curriculum Manager.
