

Hands-On Activity: Add your portfolio to Kaggle

Activity Overview

Earlier in this course, you learned about what to put in an effective data analyst portfolio. In this activity, you will add your portfolio content to a Kaggle notebook.

As you create your data analytics portfolio, you might find yourself using Kaggle or another online platform to host it. Kaggle hosts interactive notebooks that let you showcase your programming and hard work. If you have an existing portfolio, you can copy your content into Kaggle to have an additional way to share it.

By the time you complete this activity, you will have created a Kaggle notebook containing your portfolio content. Then you can easily share your work with a Kaggle link, enabling you to send your portfolio to more people.

Follow the instructions to complete each step of the activity. Then answer the questions at the end of the activity before going to the next course item.

First, it's helpful to know the different kinds of Notebooks on Kaggle. Every kind of Kaggle Notebook uses code, but each one contains different languages for programming or writing text. The different types include:

- Scripts: Typically, these are code-only documents. Cells can be formatted in Python or R, and they execute each cell as code sequentially.
- Jupyter Notebooks: Cells can be formatted in Python, Markdown, or R. These are the most flexible.
- RMarkdown scripts: Cells can be formatted in R and RMarkdown. These files are preferred by many R authors.

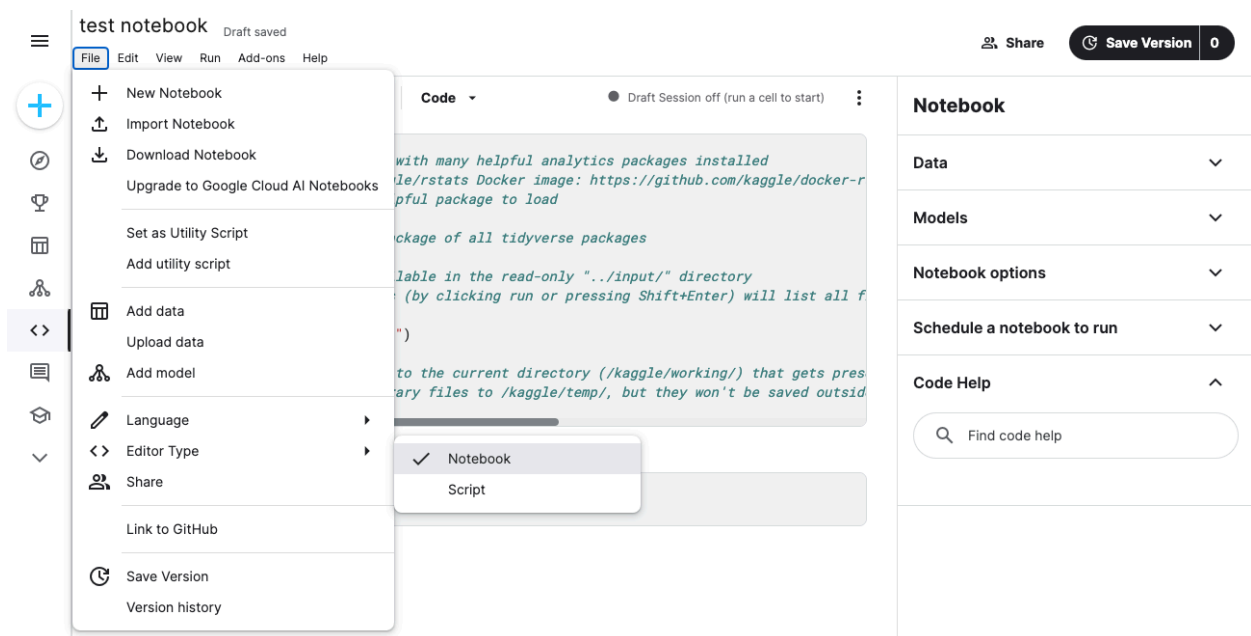

Before you create a Notebook in Kaggle, decide which kind of Notebook you intend to use.

To share the code you wrote in this course, choose a Kaggle Notebook that supports Python, such as a Python script or a Jupyter Notebook.

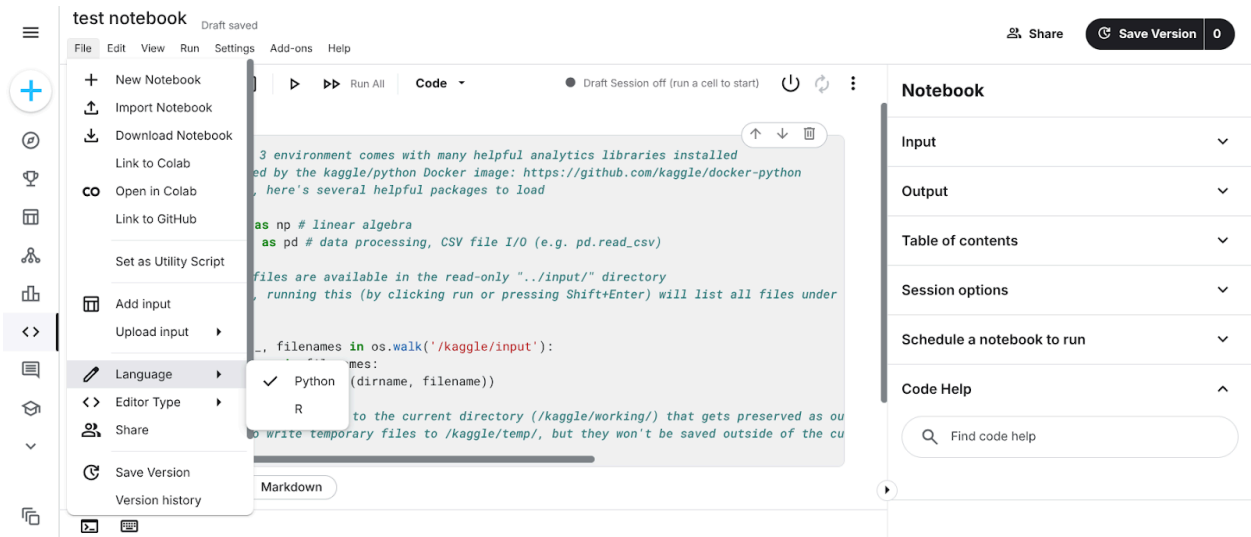

1. To begin, log in to Kaggle and go to [Kaggle.com/code](https://kaggle.com/code).

2. Select **+ New Notebook** to create a new notebook. If you want to use an existing notebook, go to the **Your work** tab and scroll to the notebook you want to use.

3. Decide whether to use a type of script or a Jupyter notebook based on your project's needs. The editor will begin as a notebook by default. If you want to change your notebook to a script, click on **File** at the top of your editor and hover over **Editor Type**. This opens a drop-down menu to select **Notebook** or **Script**. For this activity, select **Notebook**.

4. Confirm that the notebook's language is Python. Select **File** at the top of your editor and hover over **Language**. This opens a dropdown menu with options for Python and R. Select **Python** if it isn't selected already.

5. Open the file of a project you want to use in your portfolio. This can be the capstone project you completed during this course, an earlier activity you completed in a past course, or a personal project you created. Ideally, this project should demonstrate your coding ability and your data analytics knowledge.

6. Add the content of your portfolio piece. Copy the code you wrote into Python cells and copy regular text or images into Markdown cells. To add a cell to the document, select **+ Code** or **+ Markdown**. It helps to test your code in the Kaggle interface by running it periodically as you write or copy it in. This way, you ensure that it doesn't return an error.

```
import os
for dirname, _, filenames in os.walk(
    for filename in filenames:
        print(os.path.join(dirname, f

# You can write up to 20GB to the cur
# You can also write temporary files
```

+ Code

+ Markdown

7. Repeat steps 2-6 to upload your portfolio pieces to their own Kaggle notebooks.

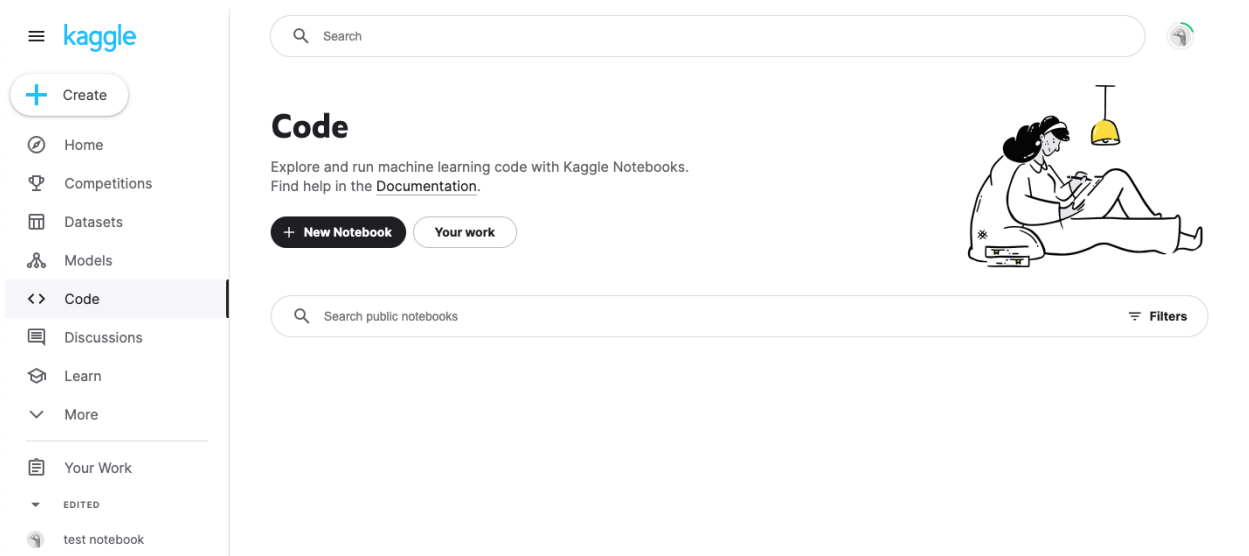

You have now created (or duplicated) your portfolio in Kaggle! Your next step is to publish your portfolio.

Now it's time to publicly publish your portfolio on Kaggle. This will allow peers, hiring managers, and potential employers to view your skill set and provide feedback.

- **Note:** When you publish your portfolio, you will also need to publicize all documents associated with it. For example, if you include a link to a

document on Google Drive, you will need to ensure it is also publicly viewable.

1. To begin, navigate to the **Your work** tab on the **Code** screen to bring you to the list of your notebooks and scripts.

2. Select the first notebook or script you'd like to publicize. At the top right-hand corner, click the **Share** button.

 Share

 Save Version

Notebook

Input

Output

3. If the Share window indicates that the document is private, click the button next to the **Public** option.

✕ Share

Private

Only collaborators can view this notebook

Public

Anyone at Kaggle can find and view under the
[Apache 2.0 License](#)

Once your project is public, you'll be able to add relevant tags or any collaborators who contributed to the document. You can use tags to describe the topics your work relates to.

4. Repeat these steps until you've made each piece in your portfolio public on Kaggle.

You have now uploaded your portfolio to Kaggle and can share your accomplishments with colleagues, hiring managers, and potential employers. You can update your portfolio as your skills as a data analyst continue to grow.

Now, share your portfolio by going to the **Your work** tab on Kaggle, selecting the project you'd like to share, and copying the URL from the address bar. Share this link to show the world your hard work!

1. Reflection

1 / 1 point

Suppose you want to add a description of your code to your Kaggle notebook. What button will enable you to create the proper cell?

- ☒ + Markdown
- ☐ + Description
- ☐ + Code
- ☐ + Text

✔ Nice work

The Markdown button will enable you to create the proper cell. It is used to format non-code text. The **+ Markdown** button adds a Markdown cell, which you can use to type and format non-code descriptions in your Notebooks. Going forward, use code cells to represent the content of your portfolio.

2. In this activity, you created or duplicated your portfolio on Kaggle. In the text box below, write 2-3 sentences (40-60 words) in response to each of the following questions:

1 / 1 point

- What is an advantage of using Kaggle as a platform for your portfolio?
- Is there another platform you will use as well as or instead of Kaggle?
- Now that you are about to finish the final course in the Google Data Analytics Certificate, which activities and projects from the course will be most effective for your portfolio?

On the Kaggle platform, many data professionals can see my work and also use it for further analysis.

Yes, GitHub, Tableau, and LinkedIn are also very useful platforms.

The 7th course and its corresponding project activities are most effective for my portfolio.

Feedback

Congratulations on completing this hands-on activity! A thoughtful response would include how putting your portfolio on Kaggle lets you conveniently host and share your work. It can be a helpful supplement or duplicate of your existing portfolio.

A public portfolio helps you showcase your work to your peers, hiring managers, and potential employers. It is crucial to develop your online presence as part of your career development. Using Kaggle, you can easily post, edit, and share your work with whoever you want to review it.
