

Myles: Driving impact with AI in the workplace

Hey, I'm Myles. I'm a data engineer here at Google. I basically maintain large databases, otherwise known as data lakes, containing our vast financial information, from CapEx to OpEx, spend to revenue, and providing that data to stakeholders. So I love being a data analyst. It's not always about crunching numbers, but a lot of it is about storytelling, as well. Being able to create appealing and visually grasping things to present to your business partners is a very, very unique thing that not a lot of other careers have experience with. It's kind of the forgotten backbone of everything we do. And, you know, without data, we really wouldn't be able to make any decisions accurately, you know, as we do now. AI is a huge deal. It's what we consider the next frontier. If we have data analytics as step one, AI is step two. In my role, I use AI daily. It makes me and all my colleagues more efficient and more productive, let alone kind of letting us automate remedial or tedious tasks that we don't enjoy. A recent time I used AI in my role here at Google was when we had to create documentation around data access.

We essentially had to consolidate about 100 different access permissions for our business partners, and create documentation for them to know where and when to request access. The reason we do this is because we maintain a lot of data around finances. And as you know, that's very confidential and need-to-know. And so creating documentation that is very easy to read and very easy to apply is essential in being a data analyst here at Google. I use this new tool or the summarization features Gemini has daily, whether that's from emails or long forms or parsing through code. It really kind of helps you get to the meat and bolts of what you wanna find in a much faster way. The advice I would give to someone starting in data analytics and utilizing AI to get there

would be trying and testing is the best way to learn how to use these tools, and understanding what you really need to provide it to get the output you want.

Treat it like it's a playground. Play around with it, mess things up, give it fake questions, give it real questions. Do anything you can to really understand what the output it's gonna give you so you can utilize that better when you really need to do something productive. A fun little tip is you can actually use AI to teach you AI. You can even ask the chatbot to teach you how to use itself. Basically, AI gives you an output, and you can ask it, how well does it think that output satisfied my input? Using these new technologies is extremely exciting.

It's almost like having a personal assistant right next to you as you're doing your work, whether you're bouncing questions and ideas off the tool or feeding it data to help you do something faster. It can really, you know, just not only save you time, but teach you a whole bunch of things, as well.

“In my role, I use AI daily. It makes me and all my colleagues more efficient and more productive.”

“Trying and testing is the best way to learn how to use these tools.”
