

The ins and outs of core data tools

Welcome back. In the next few videos,
you'll continue to explore
the data analytics tools we discussed earlier,
and you'll get the chance to see
them in action a little bit.

This will give you a clearer picture
of how to use these tools.

The rest of the program will
build on from what you learn here.

We'll start with a closer look at spreadsheets.

We'll break spreadsheets down to their basics to
better understand a few of their features and functions.

You'll also learn how you might want to use
them in your work as a data analyst.

For example, how do you
sort data to make it easier to use?

We'll find out. Next, we'll see

SQL in action. Data analysts
use SQL in their work all the time.

Like when they need a large amount of data in
seconds to help answer a quick business question.

Chances are, you're not familiar with SQL. That's okay.

You'll learn how using SQL is just like
ordering food at a super speedy restaurant.

Your SQL query might not be as
delicious but you won't
have to wait long to get your order.

Speaking of food, what better topic than dessert?

You can think of data visualization as
the dessert to the meal of data analytics.

It's served at the end of
your analysis after you've done what you
need to get the right data for a question or task.

We've already seen that
visualizations come in a lot of forms,
like graphs or charts.

Just like dessert, they're a treat to look at.

You'll learn more about these visual representations
and see other examples of how they might look.

Then you'll get to talk about visualizations
with other future data analysts just like yourself.

We'll wrap things up with an assessment,
but you'll have time to
review what you've learned before then.

Okay, let's keep going.

By the way, is anyone else hungry now?
