

Congratulations! Course wrap-up

Congratulations on finishing this first course.

You've already learned a lot

and you're ready to take what you've

learned and move forward

and if you ever need a refresher,

just remember that these videos will still

be here whenever you need them.

You might remember your next instructor from

our introduction at the beginning of the intro course.

Get ready to meet my fellow Googler

and your instructor for the next course, Ximena.

She's ready to help you get

started on your next step towards

finishing this program and becoming a data analyst.

This next course will build

directly on some of the topics you've learned

so far and give you insight

into the things we've already talked about.

Like any good detective,

you learn how to ask the right questions

and use data to find answers.

Employees in every industry
needs to become comfortable asking questions,
but this can especially be true for data analysts.
A lot of data analysts try to make their work perfect
the first time even though
they might not have all the information.
Instead of asking questions,
they make assumptions that can lead to mistakes.
It's so much better to be humble
and inquisitive and to ask questions.
I'll show you what I mean.
One of the analysts I supervise
came into Google with no coding experience.
He was nervous about leaving a great first impression,
so he tried to study up on
multiple languages by himself before he started.
When the work actually began,
he didn't ask us
his team questions or
ask us for help when he ran into roadblocks.
There are a lot of great places to find answers,
especially online,
and his initiative helped them find some of those places.
But at the end of the day,
he forgot to tap into his best resource, us,
his team, because he was nervous

about how he would be perceived if he asked us for help.

He almost missed out on

some great insights from his team members.

As roadblocks persisted, he

realized he needed to make a change.

He stopped trying to guess expectations, processes,

and more all on his own and

started asking us more questions.

As soon as he **embraced** this new approach,

he **skyrocketed** on our team.

His learning went straight up

the curve like a hockey stick.

His impact on the organization,

the number of people who reached out to him and his

career path going for it all did the same.

The bottom line is,

you don't need to know it all.

The saying is true,

there are no bad questions.

Being open to learning is one of

the most important qualities for a data analyst.

Speaking of learning, in the next course,

we'll go into more depth learning about

basic spreadsheet skills and when you need to use them,

you'll discover how to apply

structured thinking to data work,

and your focus on how to best meet
stakeholder needs and expectations
by gathering all the clues.
Great work, and good luck on the next course.
