

Introduction of BigQuery

[00:00](#) Okay, data enthusiasts, now that we know what cloud-based data warehouses are, we should probably figure out which one suits our needs.

[00:07](#) And I've got a great one to introduce to you.

[00:10](#) Meet **BigQuery: Google's powerhouse of storage and analysis.**

[00:14](#) An organization's data is vital to its business success.

[00:18](#) And data warehousing helps make the most of that data by providing quick and easy access to information, which leads to ideas, insights, and, best of all, data-driven decision-making.

[00:32](#) **BigQuery is a data warehouse on Google Cloud** that helps users store and analyze data right within BigQuery.

[00:39](#) They **can query data, filter large datasets, aggregate results, and perform some really complex operations.**

[00:47](#) **BigQuery works with SQL, or structured query language.**

[00:51](#) This is a computer programming language used to communicate with the database.

[00:56](#) It allows users to search through massive amounts of data —and find information they are searching for— incredibly quickly using Google infrastructure.

[01:06](#) As a **cloud data analyst, BigQuery's integrated SQL interface and machine learning** capabilities will help you discover, implement, and manage data tools to inform critical business decisions.

[01:18](#) **The output of your work in BigQuery can integrate with typical business intelligence tools or spreadsheets.**

[01:25](#) But there's a lot more to explore.

[01:27](#) Another feature is **BigQuery's ability to easily migrate** existing data warehouses from other cloud service providers.

[01:34](#) This is a huge timesaver!

[01:36](#) One of my favorite things about **BigQuery is its dry-run parameter.**

[01:40](#) This lets you **check your query thought process and plan before actually running it.**

[01:46](#) And BigQuery will tell you the number of bytes the query will run so you can estimate the cost before actually querying the database.

[01:53](#) It's like a practice swing in golf to help you make sure your ball goes in the hole!

[01:58](#) You can also use BigQuery to store, explore, and run queries on data gathered from servers, sensors, and other devices.

[02:05](#) And scheduled queries can be used to automatically refresh data and keep tables up to date.

[02:12](#) Data can be updated hourly, daily, or weekly, so you'll deliver the most dynamic, timely metrics to your stakeholders.

[02:20](#) On my team, we use BigQuery almost daily to query, transform, and report on data.

[02:26](#) Using BigQuery, we're able to tap into a multitude of data sources, which allow us to support our users with the most relevant insights.

[02:35](#) We use SQL to join datasets and transform the data, creating tables and charts that provide answers.

[02:41](#) And when we land on an answer that can be useful in the future, we scale it, building self-service

[02:46](#) reports and dashboards that allow users to retrieve the same answer over and over again in a timely manner.

[02:55](#) For my team, BigQuery helps us create a bridge between the data that exists and the problems folks are trying to solve or questions they're trying to answer.

[03:03](#) With its smooth integration with other tools, user-friendly interface, and the use of SQL for effective programming, BigQuery makes the discovery of valuable information within complex datasets simple and productive.

[03:16](#) It's an essential part of the cloud data analyst's toolbox.

[03:20](#) There's tons to explore, so have some big fun getting to know BigQuery.

[03:26](#) This will be an invaluable tool for your cloud career!
