

The cloud Impact on education

[00:01](#) My name is Ben, and I'm the senior vice president of Learning and Sustainability at Google.

[00:06](#) I'd always been interested in learning because for me, my mom, my mother was a school teacher, and

[00:11](#) I felt that learning is really what enables people to reach a different point than they otherwise would.

[00:20](#) I know it enabled me to go to a place I could not have dreamt of being, were it not for the education I got.

[00:25](#) And I think that's incredibly important for people to have access to that kind of opportunity.

[00:33](#) And growing up in India, I did have access to a good school.

[00:35](#) I did not come from wealthy family but I had access to a good school, and I saw the difference it made in my life.

[00:41](#) And I think today, with the help of technology, we can hopefully bring more of that opportunity to more people in the world.

[00:48](#) The cloud is really important because it's a trajectory of where computation is going.

[00:53](#) If you think about all of the major products that you use, almost all of them are now based in some online cloud data

[01:00](#) center, and they have access to all these amazing computing resources, and they enable these services to really provide amazing things for their users.

[01:10](#) So studying cloud technologies enables you to participate in that whole economy of jobs and of opportunities that

[01:18](#) consist of building these powerful facilities in the cloud that are being used by people around the world.

[01:24](#) One of the really interesting ways in which education is evolving is allowing people to build and learn individual skills through various skilling courses.

[01:33](#) Many aspects of education are not available to everybody everywhere, unfortunately.

[01:38](#) But it's possible to build the basic skills that one needs from an education more piecemeal today.

[01:45](#) And I think the approach of skilling can allow people to build up the pieces of the education that they really need in

[01:51](#) the way that they have access to, in the way that they have time for, in a way that they have the resources for.

[01:59](#) The initial parts of learning anything are learning the basics and the fundamentals, whether it is a sport or a physical skill like carpentry, whatever.

[02:08](#) The first steps are learning the basics.

[02:11](#) So persevere with it and it'll get really interesting.

[02:14](#) I've been working with computers for, what is it now?

[02:16](#) Over 30, 35 years, and it is still fascinating every day.
