

Test your knowledge: Foundations of cloud computing

1. For organizations, what does cloud computing eliminate the need for?

Ans- Organizations no longer need to find, set up, or manage resources themselves

Note- Cloud computing allows organizations to use computing resources as services hosted over the internet; this eliminates the need for organizations to handle these tasks on their own.

2. A company is developing a new app. It needs a platform where their developers can focus solely on building the app without considering underlying infrastructure. Which cloud service model should the company choose?

Ans- Platform as a service, or PAAS

Note- PAAS provides the environment and tools needed for application development, enabling developers to focus solely on the app development process.

3. What is one of the main advantages of accessing data in cloud computing?

Ans- Organizations can access and manage data, software, storage, and cloud infrastructure from any location at any time through the internet.

Note- The ability to access and manage data, software, storage, and cloud infrastructure from any location at any time through the internet is one of the main advantages of accessibility in cloud computing.

4. What type of storage in a cloud computing infrastructure keeps data in a simple, easy-to-understand way through a hierarchy of files in folders?

Ans- File storage

Note- File storage organizes data through a hierarchy of files in folders, making it the oldest and most widely used data storage system.

5. An organization wants to make sure its data is safe and secure, even during an emergency. Which common use of cloud computing should they consider?

Ans- Disaster recovery

Note- Disaster recovery means having access to more data centers to ensure that data and information is safe and secure during an emergency.
