

Activity Quiz: Design a data lifecycle plan

- ✓ 1. When in the planning stage of the data lifecycle, which of the following is important to consider to ensure you meet stakeholders' needs?
- ☐ Personally identifiable information (PII)
 - ☐ Available data sources
 - ✓ ☒ Stakeholder's business plans and objectives
 - ☐ When the data will be destroyed

When planning the data lifecycle, understanding the stakeholder's business plans and objectives is crucial. These plans and objectives help you identify the specific data you need to collect, maintain, and analyze to support their goals

- ✓ 2. Which of the following examples is a good, actionable recommendation based on the stakeholder statement that the data contains credit card information?
- ☐ Retain the credit card information indefinitely.
 - ✓ ☒ Collect and store only the essential credit card information required for your specific business purpose.
 - ☐ Store all credit card information in a single table.
 - ☐ Allow all users to access credit card information.

Minimizing the amount of credit card information you store significantly protects PII security by limiting the potential damage in case of a data breach.

✓ 3. Which of the following is NOT typically part of the capture stage of the data lifecycle plan?

- ☐ Identifying data gaps
- ☐ Locating data sources
- ☐ Data transformation
- ✓ ☒ Destroying data

The capture stage involves locating data sources, assessing potential data gaps, and formatting the data for further analysis. Destroying data is part of the destroy stage.

✓ 4. Which statement best describes why it is important for an organization to have an up-to-date data lifecycle plan?

- ☐ A data lifecycle plan is a one-time plan written by an organization just getting started on the cloud.
- ✓ ☒ A data lifecycle plan is an essential tool that helps you proactively manage your data, optimize data storage, and keep your data secure.
- ☐ A data lifecycle plan is the only thing you need to create to secure your data.
- ☐ A data lifecycle plan is mainly about optimizing storage.

A data lifecycle plan is a great tool that helps organizations of all sizes efficiently handle data management, safeguard security, and make it easier to govern your data.
