

Test your knowledge Cloud data tools

- ✓ 1. A streaming video content company seeks advice from a cloud professional about creating a data pipeline. The company wants a recommendation for a data management tool that can build a pipeline to stream data from various applications and computers into a single database. Which cloud data solution should the cloud professional suggest?

✓ Dataflow

☐ BigQuery

☐ Looker

☐ Dataproc

Dataflow can create a data pipeline that can stream or batch process data from various apps or computers into one database.

- ✓ 2. A company wants to create a real-time data pipeline to process and analyze streaming data from its Internet of Things, or IoT devices. The company also needs to be able to store and query the data for historical analysis. Which Google Cloud Platform is best suited to help this company?

☐ Looker

✓ ☒ Dataflow

☐ Dataproc

☐ BigQuery

Dataflow is a fully-managed service for unified stream and batch data processing. It is well-suited for building real-time data pipelines and processing large amounts of data in a distributed manner.

- ✓ 3. A company needs a scalable and Hadoop-compatible service to process a large amount of historical data to identify trends and patterns. Which Google Cloud Platform is best suited to help this company?

☐ Looker

☐ BigQuery

✓ ☒ Dataproc

☐ Dataflow

DataProc is well-suited for processing large amounts of data and running complex machine learning tasks, and it is compatible with Hadoop.

- ✓ 4. A nonprofit organization needs help with large-scale analytics on both structured and unstructured data. The organization wants to use an open-source tool for batch processing, querying, streaming, and machine learning. Which data analytic tool should the nonprofit use?

✓ Dataproc

☐ BigQuery

☐ Dataflow

☐ Looker

DataProc is an open-source tool for batch processing, querying, streaming, and machine learning.

✗ 5. A cloud team has made the decision to use Google Cloud Storage as a data management tool. During a meeting, a company executive asks why the team made this decision. Which of the following statements supports the data team's decision?

- ☐ Google Cloud Storage allows the cloud team to stream data from the company's various applications into one database.
- ☐ Google Cloud Storage allows the cloud team to write SQL queries to join data and clean the data to ensure it is complete.
- ☐ Google Cloud Storage allows the cloud team to move the company's application databases, analytics, and data science tools into one place.
- ✗ ~~Google Cloud Storage allows the cloud team to create data integrations, run high-volume data pipelines, and continuously integrate user data.~~

Google Cloud Storage hosts data from remote servers, including application databases, analytics, and data science tools, all in one place. Cloud Data Fusion is used to create data integrations, run high-volume data pipelines, and continuously integrate user data.
